Kai Otasowie

Full-Stack Developer

astadevel@outlook.com · github.com/astadevelgit

SUMMARY

Full-stack developer with a BSc in Computer Science, building complete web products with TypeScript, Next.js, React, and PostgreSQL. Owns the work end to end: schema, server actions, authentication, money handling, and deployment. Strong on correctness under concurrency — idempotency, row locking, row-level security, and auditable state changes.

TECHNICAL SKILLS

Languages	TypeScript, JavaScript, Python, SQL
Frontend	React 19, Next.js 16 (App Router, Server Actions, Cache Components), Tailwind CSS 4, shadcn/ui
Backend	Node.js, PostgreSQL, Supabase (Auth, RLS), Prisma, Drizzle ORM, Zod, REST route handlers
Security	Row-level security, session rotation, CSRF, Argon2id, rate limiting, CSP/HSTS
Tooling	Git, GitHub, Vercel, ESLint, TypeScript strict mode

PROJECTS

BetApp — Play-Money Football Betting Platform

Live · Code

Next.js 16 · React 19 · TypeScript · Supabase · Drizzle · Tailwind CSS

- Built and deployed a private-beta sportsbook with live EPL fixtures and odds, single and accumulator bet slips, a coin wallet, and automatic settlement across four markets.
- Designed an atomic Postgres betting engine: wallet and catalog row locks, per-leg odds snapshots, idempotency keys, duplicate-match rejection, and a stale-odds cutoff; all wallet mutations run through security-definer RPCs with integer accounting.
- Implemented idempotent settlement for win, loss, void, and refund cases, plus an audited admin console for settle/void, balance adjustments, and user suspension.
- Hardened with RLS on every user table, fixed-window rate limits in Postgres, advisory-lock beta-cap enforcement, and CSP/HSTS/noindex headers; validated provider sync at 10 fixtures, 20 markets, 50 selections, zero failures.

Stride — Multi-Tenant Point-of-Sale Platform

Private build

Next.js 16 · React 19 · TypeScript · Prisma · PostgreSQL / SQLite · Argon2id

- Built a working POS vertical slice: checkout, split payments, per-line discounts, inventory ledger, shifts, printable receipts, CSV reports, and role-based access across five roles.
- Implemented database-backed sessions with rotation, double-submit CSRF, Argon2id hashing, and per-account and per-IP login rate limits.
- Made sales server-authoritative and idempotent: totals recomputed from the database, client UUIDs prevent double charges, and stock moves post to an append-only ledger.

EXPERIENCE

Freelance Full-Stack Developer · Self-employed · Present

- Design and ship web applications end to end: schema, server actions, authentication, deployment, and handover.
- Run production deployments on Vercel with Supabase/PostgreSQL backends, including provider sync, rate limiting, and audited admin tooling.

EDUCATION

BSc Computer Science
